TITLE : ACTIVE MATRIX TYPE LIQUID
CRYSTAL DISPLAY DEVICE, ITS
DRIVING METHOD AND
MANUFACTURE

ABSTRACT : PROBLEM TO BE SOLVED: To inexpensively provide an orientation division type liquid crystal display device having a wide visual angle without requiring the increment of processes.

SOLUTION: Each auxiliary electrode 4 is formed in an almost center part between two pixel electrodes 3 in parallel with signal electrodes 5 and the strength of an electric field between the electrodes 4 and a counter electrode 6 is set up higher than that between the electrodes 3 and the electrode 6 so that the directions of both the electric fields are almost equal. Consequently the pixel electrodes 3 arranged on both sides of the auxiliary electrode 4 can be divided into two stable orientation areas A, B in which the inclinations of liquid crystalline molecules 7 are mutually reversed.
